

## END FOR END 8x3-STRAND CLASS II

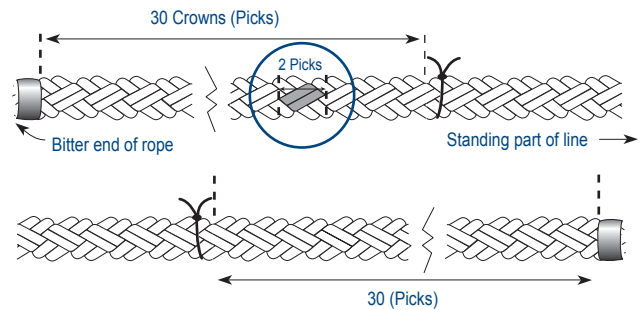

Class II construction ropes are made in whole or part from any of the following high modulus fibers: Dyneema®, Vectran®, Technora®, and Zylon®.

Additional rope needed for splice:  
length of 30 crows x 2.

STEP 1

### GETTING STARTED

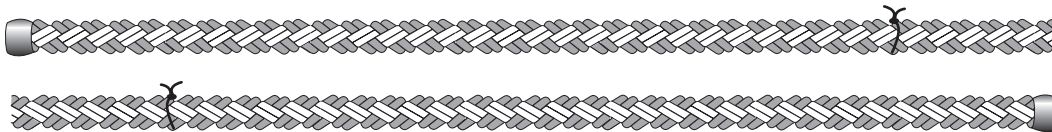

Lay ropes out and count 30 picks or crowns from end of both ropes. Tie string or tape securely at these points

STEP 2

### MARKING

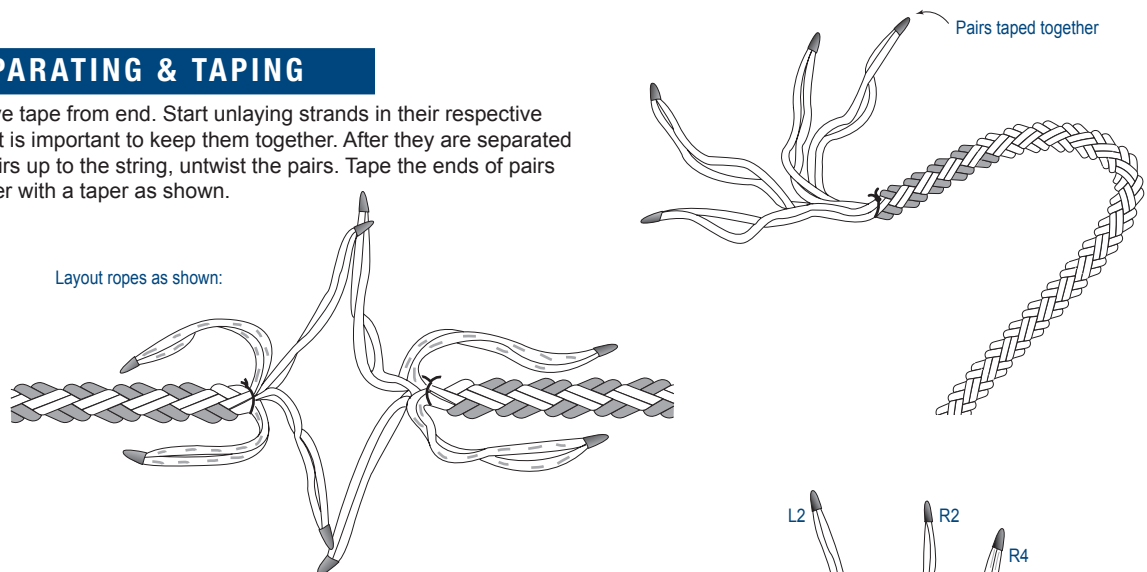

Holding the end of the rope, note the pairs of strands going to the left. Mark these pairs. Mark the strands up to the string and continue to mark the strands for five (5) or more picks beyond the strings.

STEP 3

### SEPARATING & TAPING

Remove tape from end. Start unlaying strands in their respective pairs. It is important to keep them together. After they are separated into pairs up to the string, untwist the pairs. Tape the ends of pairs together with a taper as shown.

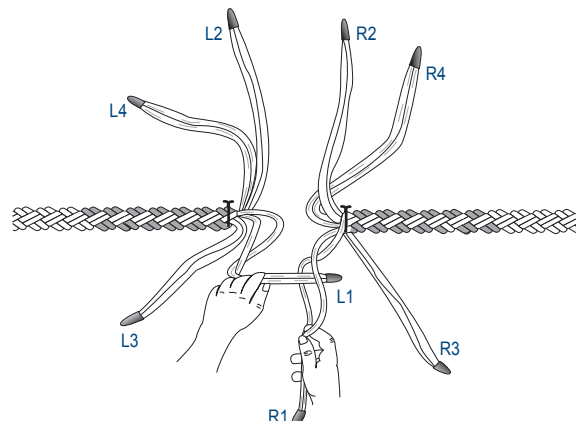

STEP 4

### JOINING THE STRANDS

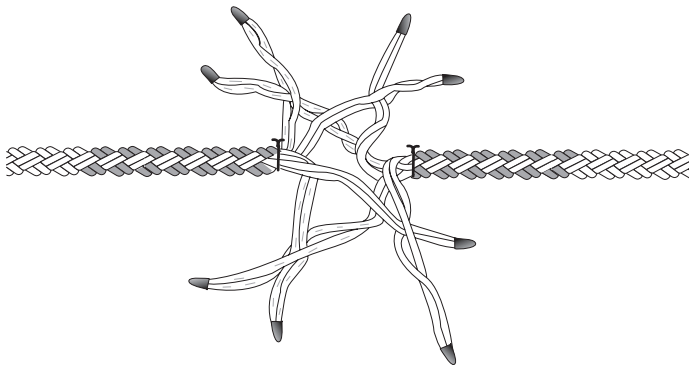

It is important that the next steps of the procedure be followed carefully.

Marked L {1} Strands go between Marked R {1} Strands  
Unmarked R {2} Strands go between Unmarked L {2} Strands  
Unmarked L {3} Strands go between Unmarked R {3} Strands  
Marked R {4} Strands go between Marked L {4} Strands

**END FOR END 8x3-STRAND CLASS II**

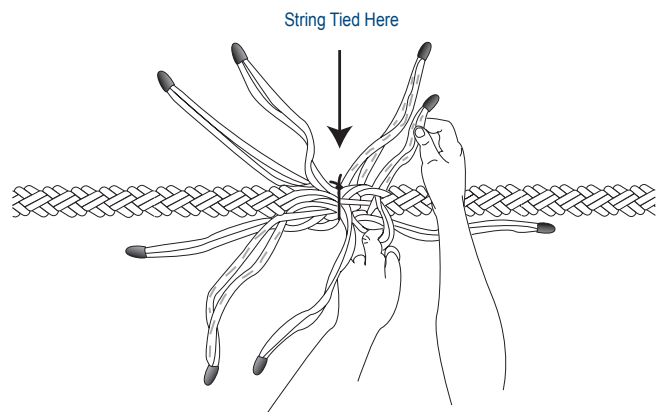

**STEP 5** After the initial step has been completed, you should have something that looks like the drawing at left. Marry the ropes as shown in Step 6. This part is preferably a two-person job. Cut the string that you previously tied at the splicing points of both ropes.

**STEP 6 MARRYING THE ROPES**

Keep the ropes together snugly. Tie a piece of string tightly around the splicing point as shown at right.

Start your splice. A marked pair under an unmarked pair of strands. Now you can follow the same procedure as the eyesplice. But we suggest that you complete one (1) full tuck in one direction and then do a full tuck on the other side of the marriage. Pull everything tight before proceeding.

**STEP 7 FINISHING THE SPLICE**

Complete splicing in both directions so that each side is finished off as per strand reduction sequence (steps 7-10) of the eye splice procedure.
