

## DEEP SIX ROPE TO CHAIN SPLICE 6-STRAND

STEP 1

### PREPARING THE ROPE

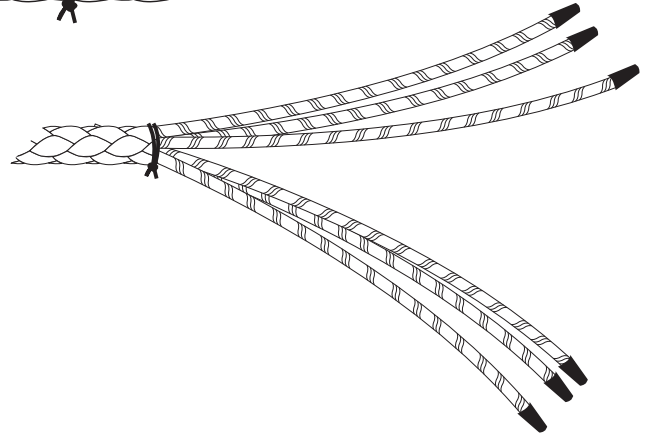

Getting Started: From one end of the rope, measure back 1 tubular fid length. Tie securely at mark with 2-3 wraps of small twine.

STEP 2

### UNLAY & DIVIDE STRANDS

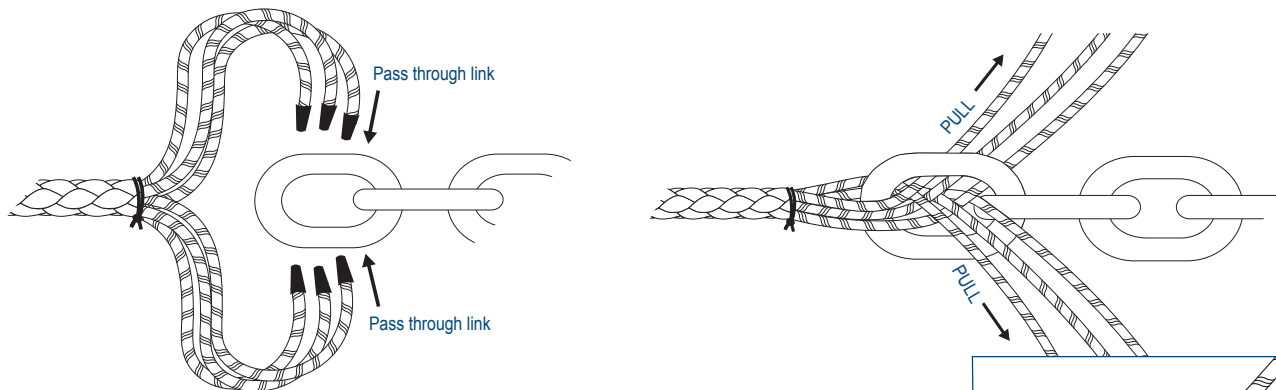

Unlay the rope up to the mark then tape the end of each strand. Divide the six strands into two groups as shown.

STEP 3

### THREADING THE CHAIN

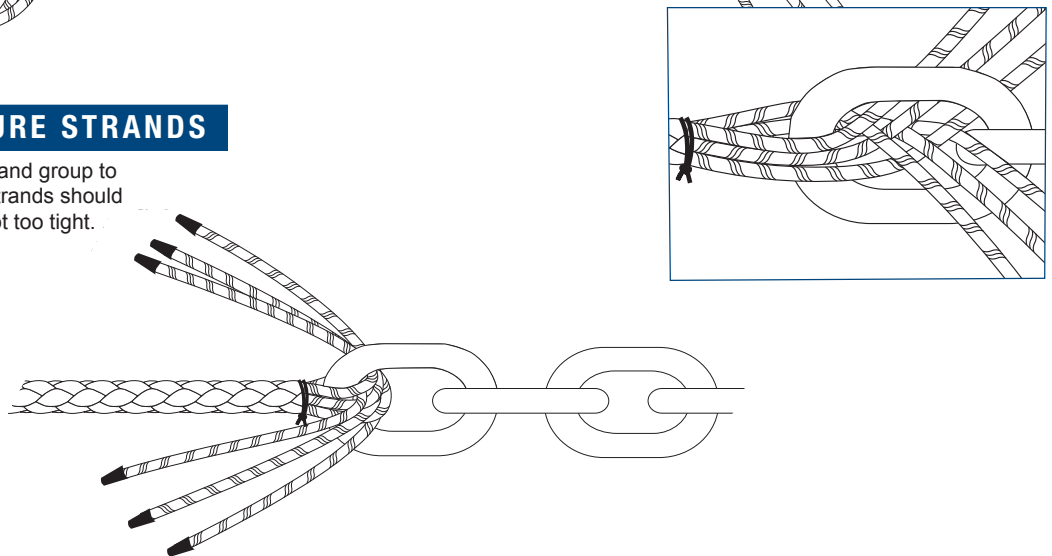

Pass the two groups through the last chain link in opposite direction as shown.

STEP 4

### PULL & SECURE STRANDS

Pull gently on each strand group to draw the link close. Strands should be snug on link, but not too tight.

## DEEP SIX ROPE TO CHAIN SPLICE 6-STRAND

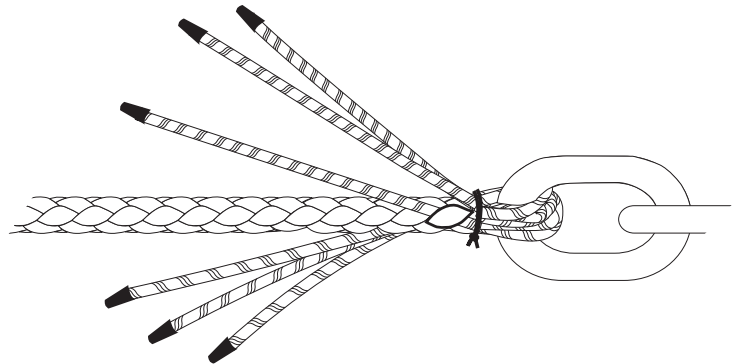

STEP 5

### TUCKING THE STRANDS

Starting with one strand group, make one tuck with each strand. A tuck consists of passing one strand under of the standing part of the rope. Adjacent strands should be tucked under adjacent rows of strands in the braid.

Be sure to maintain the original twist level in the strands while performing the tucks.

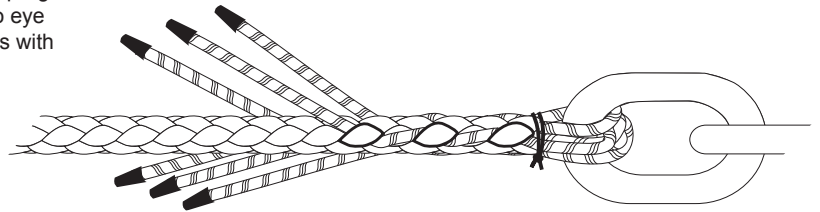

Turn splice over and make one tuck each with the remaining three strands

STEP 6

### CONTINUE ADDITIONAL TUCKS

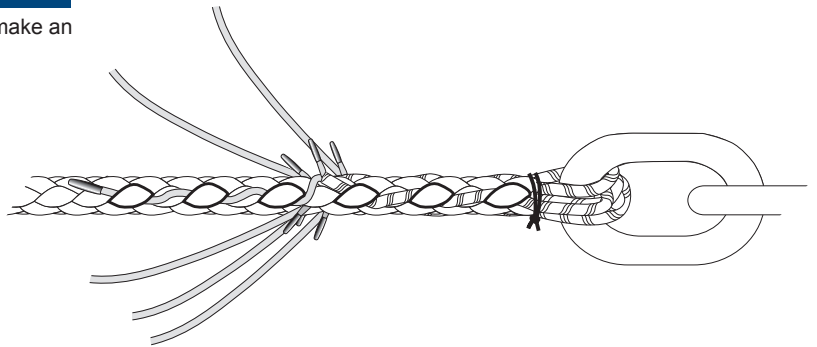

After the initial tuck, each tuck will consist of crossing over one strand, then under one strand, and will progress straight down the axis of the rope. (Refer to eye splice instructions). Make an additional two tucks with each strand in this fashion.

STEP 7

### CUT AWAY HALF OF STRANDS

Cut away half of the yarns in each strand and make an additional 3 tucks with each half-strand.

STEP 8

### TUCK HALF STRANDS

Trim all tails to a length approximately equal to the rope diameter.
